Subject: Protect our water from dangerous fracking

Apr 23, 2014

Ms. Regina McCarthy
William Jefferson Clinton Federal Building, Room 3000
1200 Pennsylvania Avenue, NW
Washington, DC 20460-0001

Dear Ms. McCarthy,

Please reopen the EPA's investigations into groundwater contamination linked to fracking activity in Parker County, TX, Dimock, PA and Pavilion, WY.

These EPA investigations found evidence of possible groundwater contamination, raising alarms that the water was unsafe for residents. The contamination in all three cases was believed to be linked to nearby fracking activity.

In all three cases, the EPA abruptly pulled out, leaving people to worry whether their water was safe to drink. But a recent report from your agency's own internal watchdog puts the groundwater safety in one of these locations in question. The December 24, 2013 Inspector General report into the Parker County, TX case shows the EPA had enough evidence to take on this case, the overall risk of contamination hasn't been determined and the EPA still needs to take action to assess the risk to the public. The report also states that senior EPA officials and a senior attorney from the Justice Department agreed there was enough evidence to enforce the EPA order through the courts.

This watchdog report should cause any citizen to call the EPA's decisions in all three locations into question. The EPA should end the confusion, frustration and fear and reopen all three investigations.

It's the duty of the EPA to protect our health and environment. Please reopen the investigations and commit to protecting Americans from any dangers associated with fracking activity.

Sincerely,

Mr. Nick Ignelzi
